LING10 Statistics for Linguistics
Dartmouth College. Winter 2026

Final project
Part 4. Final Project Code and Writeup

You need to do THREE things:

(1) Construct a statistical model where you predict a y-variable using a linear model (LM), a linear mixed-effects model (LMER) or a generalized linear model (GLM). You need to include more than one predictor variable. (You should conduct a careful analysis of why two variables should or shouldn't interact).

Please document your R code with your name, your email, and a brief description of what the program does. Also, include appropriate documentation so that I can understand the different sections of the program. (For example, the section where you test the assumptions, the section where you calculate the model, etc).

(2) Write a short document of a **MAXIMUM OF FIVE PAGES**, that includes the following:

a. A title that clearly explains what the project is about, as well as your name and e-mail address.

b. An introduction section, where you explain your goal and state your hypothesis. Here you also need to present a summary of previous work by other people and its relevant references. In general, your introduction should answer the question: "Why is this interesting or relevant"?

c. A methodology section. Here, you present your data. How much data do you have? How did you obtain it? Did you have to transform it in some way? What are the variables that you studied? Does the data meet the assumptions of an LM/LMER/GLM? If not, clearly state the assumptions you will be using.

d. A results section, where you report on your LM/LMER/GLM and its results. Describe any interactions and main effects that are significant. Perform post-hoc tests as necessary. Make sure to include graphics that help understand your results.

e. A discussion section. Here, you will discuss the results and what they mean for linguistics. Does the data behave as you expected it? What is the answer to the hypothesis you proposed? How does this relate to other linguistic ideas?

f. A conclusions section. This has a summary of your results and of their significance. This section also proposes "future work", which are ideas for how you would design a new experiment that could help corroborate your results.

g. A reference section. You can use any citation system, as long as you are consistent.

(3) Write a 500-word summary of your work. You need to do this using the LSA (Linguistic Society of America) abstract format. You should look at the *Abstract Format Guidelines* and *Abstract Contents* sections of the LSA 2026 call for abstracts. You can also look at the *Model Abstracts* of the LSA. (The LSA is famously strict with their abstracts!)

Evaluation

This work constitutes 15% of your final grade. You will submit a Word/LibreOffice/PDF document for your write, as well as the R file with your model and the data you used to calculate your results.

You need to submit your work by 5pm of Tuesday, March 17th, 2026. This is a hard deadline, as this is the end of final examinations set by the Registrar. If you cannot make the deadline, please contact your Student Dean, who will then contact me.
